

Previous-years comparison (v2) — Germany & federal states

Is the 2026 surge in balcony-PV registrations really an outlier? When does it start?

2026-05-11

Table of contents

1. Setup & event table	1
2. Figure 1 — local view around each war date (anticipation diagnostic)	2
3. Figure 2 — Germany year-to-date totals (Jan – early May)	2
4. Daily registrations, calendar overlay across years	3
Figure 3.1 — Balcony PVs, 7-day moving average	3
Figure 3.2 — Non-balcony PVs, 7-day moving average (control)	5
Figure 3.3 — Balcony PVs, raw daily registrations (no smoothing)	5
5. Figure 6 — Germany cumulative year-to-date	6
6. Figure 7 — Germany weekly view (less noise)	7
7. Federal-state heterogeneity	8
Figure 8.1 — Weekly registrations per 100k, by federal state	8
Figure 8.3 — Year-to-date totals by federal state and year	10

All charts overlay **2026 (red)** on **prior years (blue palette, light → dark)**. Data run through **2026-05-07**, so all year-on-year comparisons are restricted to the same Jan – early-May window.

1. Setup & event table

Table 1: Iran war 2026 — events used in this report.

Date	Event	Primary?
08 Jan 2026	Iran protest crackdown peak	no
14 Feb 2026	US military buildup	no
28 Feb 2026	War begins / Hormuz closed	yes
18 Mar 2026	Major escalation	yes
08 Apr 2026	Temporary 2-week ceasefire	yes

2. Figure 1 — local view around each war date (anticipation diagnostic)

Outcome: **daily new balcony-PV registrations per 100k** in a ± 21 -day window around each event (day 0 = event). Grey bars = raw daily counts; red line = centred 7-day moving average ($\bar{n}_t^{(7)} = \frac{1}{7} \sum_{k=-3}^3 n_{t+k}$). The vertical dashed line marks day 0. Reading guide: if the red line is already rising in the negative-day region (left of the dashed line), that is an **anticipation** signal.

Figure 1 — Daily balcony-PV registrations around each war milestone

Germany. ± 21 days around event (day 0 = event). Grey bars = raw daily; red line = centred 7-day MA.

3. Figure 2 — Germany year-to-date totals (Jan – early May)

Outcome: number of new registrations from 1 January to 07 May of each year, per 100k inhabitants. Like-for-like window across years.

Figure 2 — Year-to-date registrations through 07 May, by year

Outcome: number of new registrations per 100k inhabitants (Germany)

4. Daily registrations, calendar overlay across years

Figure 3.1 — Balcony PVs, 7-day moving average

Outcome: 7-day moving average of daily new balcony-PV registrations, per 100k. Formula:

$\bar{n}_t^{(7)} = \frac{1}{7} \sum_{k=0}^6 n_{t-k}$ (right-aligned). Vertical lines = Iran-war milestones, labelled.

Figure 3.1 — Balcony PVs: daily new registrations (7-day MA), Jan–early May overlay

Germany. 2026 (red) vs 2022–2025 (blue palette, light → dark). Per 100k inhabitants.

Figure 3.2 — Non-balcony PVs, 7-day moving average (control)

Figure 3.2 — Non-balcony PVs: daily new registrations (7-day MA), Jan–early May overlay
Germany. Control series: shock should be much weaker or absent here.

Figure 3.3 — Balcony PVs, raw daily registrations (no smoothing)

Same overlay as 3.1 but using the **raw daily count** instead of the 7-day MA. Noisier but honest — every spike is a real day.

Figure 3.3 — Balcony PVs: raw daily new registrations, Jan–early May overlay

Germany. Raw daily counts, no smoothing. Per 100k inhabitants.

5. Figure 6 — Germany cumulative year-to-date

Outcome: cumulative number of new balcony-PV registrations per 100k, reset on 1 January of each year. The day where the 2026 line breaks away from the prior-year lines marks the start of the cumulative deviation.

Figure 6 — Balcony PVs: cumulative year-to-date registrations

Germany. Counter resets on 1 January each year. Per 100k inhabitants.

6. Figure 7 — Germany weekly view (less noise)

Outcome: number of weekly new balcony-PV registrations per 100k. Smoother than daily; easier to read off the post-war jump.

Figure 7 — Balcony PVs: weekly new registrations, Jan–early May overlay

Germany. Per 100k inhabitants.

7. Federal-state heterogeneity

Figure 8.1 — Weekly registrations per 100k, by federal state

Same calendar overlay as Figure 7 but faceted across the 16 federal states. Larger linewidths to distinguish each year.

Figure 8.1 — Balcony PVs: weekly registrations per 100k, by federal state

2026 (red) vs 2022–2025. Black verticals = primary events: war start (28 Feb), major escalation (18 Mar), ceasefire (8 Apr).

Figure 8.3 — Year-to-date totals by federal state and year

Figure 8.3 — Balcony PVs: Jan-07 May YTD registrations per 100k, by federal state and year
States ordered by 2026 intensity (highest left).
