

Previous-years comparison (v2) — Germany & federal states

Is the 2026 surge in balcony-PV registrations really an outlier? When does it start?

2026-05-11

Table of contents

1. Setup & event table	1
2. Figure 1 — Local view around each war date (anticipation diagnostic)	1
3. Figure 2 — Balcony PVs, raw daily registrations (no smoothing)	2
4. Figure 3 — Balcony PVs, 7-day moving average	3
5. Figure 4 — Non-balcony PVs, 7-day moving average (control)	4

All charts overlay **2026 (red)** on **prior years (blue palette, light → dark)**. Data run through **2026-05-07**, so all year-on-year comparisons are restricted to the same Jan – early-May window.

1. Setup & event table

Table 1: Iran war 2026 — events used in this report.

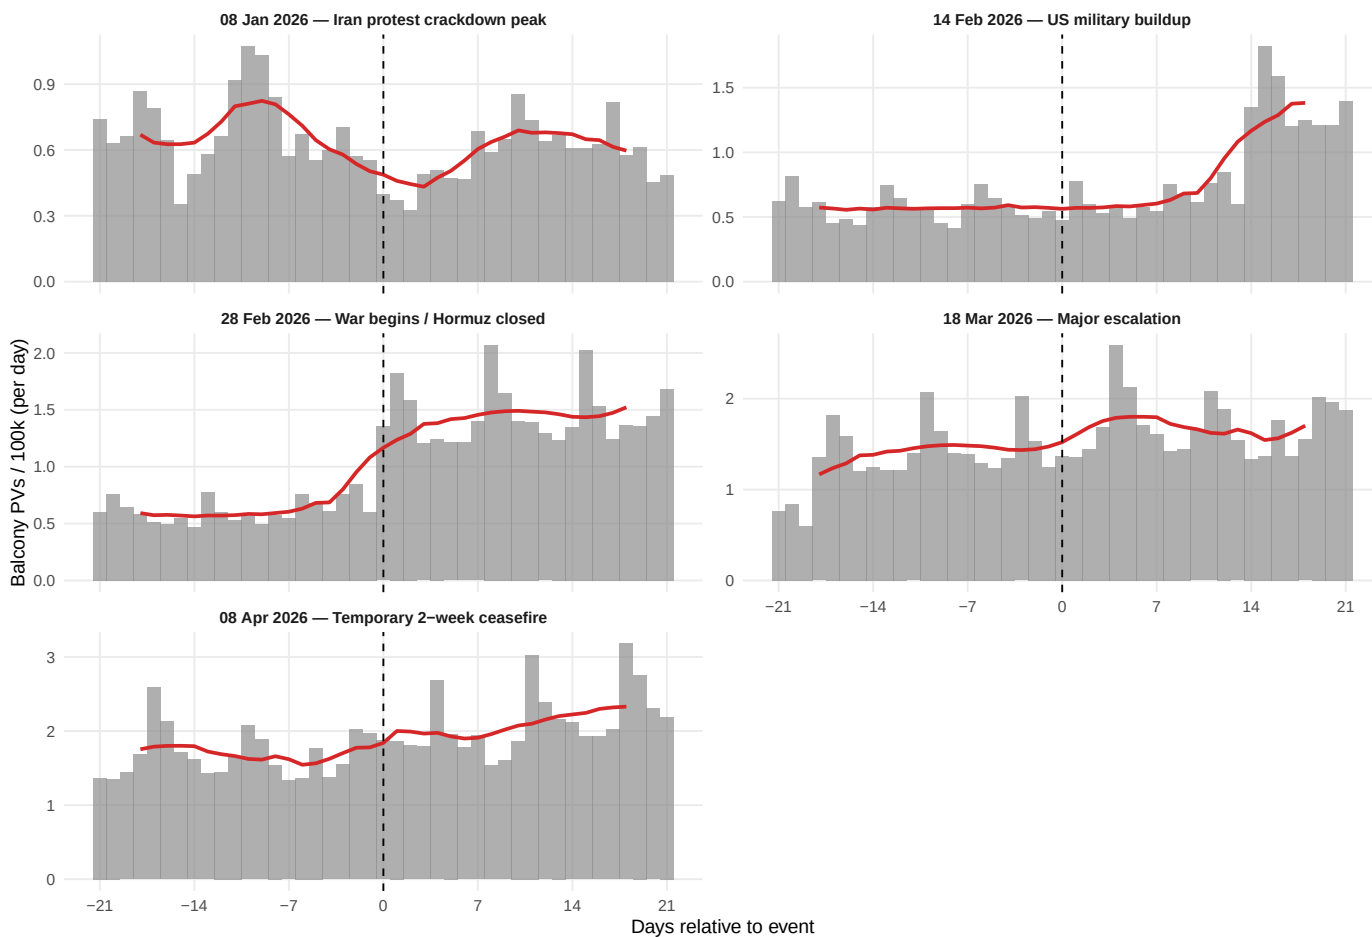

Date	Event	Primary?
08 Jan 2026	Iran protest crackdown peak	no
14 Feb 2026	US military buildup	no
28 Feb 2026	War begins / Hormuz closed	yes
18 Mar 2026	Major escalation	yes
08 Apr 2026	Temporary 2-week ceasefire	yes

2. Figure 1 — Local view around each war date (anticipation diagnostic)

Outcome: **daily new balcony-PV registrations per 100k** in a **±21-day window** around each event (day 0 = event). Grey bars = raw daily counts; red line = centred 7-day moving average ($\bar{n}_t^{(7)} = \frac{1}{7} \sum_{k=-3}^3 n_{t+k}$). The vertical dashed line marks day 0. Reading guide: if the red line is already rising in the negative-day region (left of the dashed line), that is an **anticipation** signal.

Figure 1 — Daily balcony-PV registrations around each war milestone

Germany. ± 21 days around event (day 0 = event). Grey bars = raw daily; red line = centred 7-day MA.

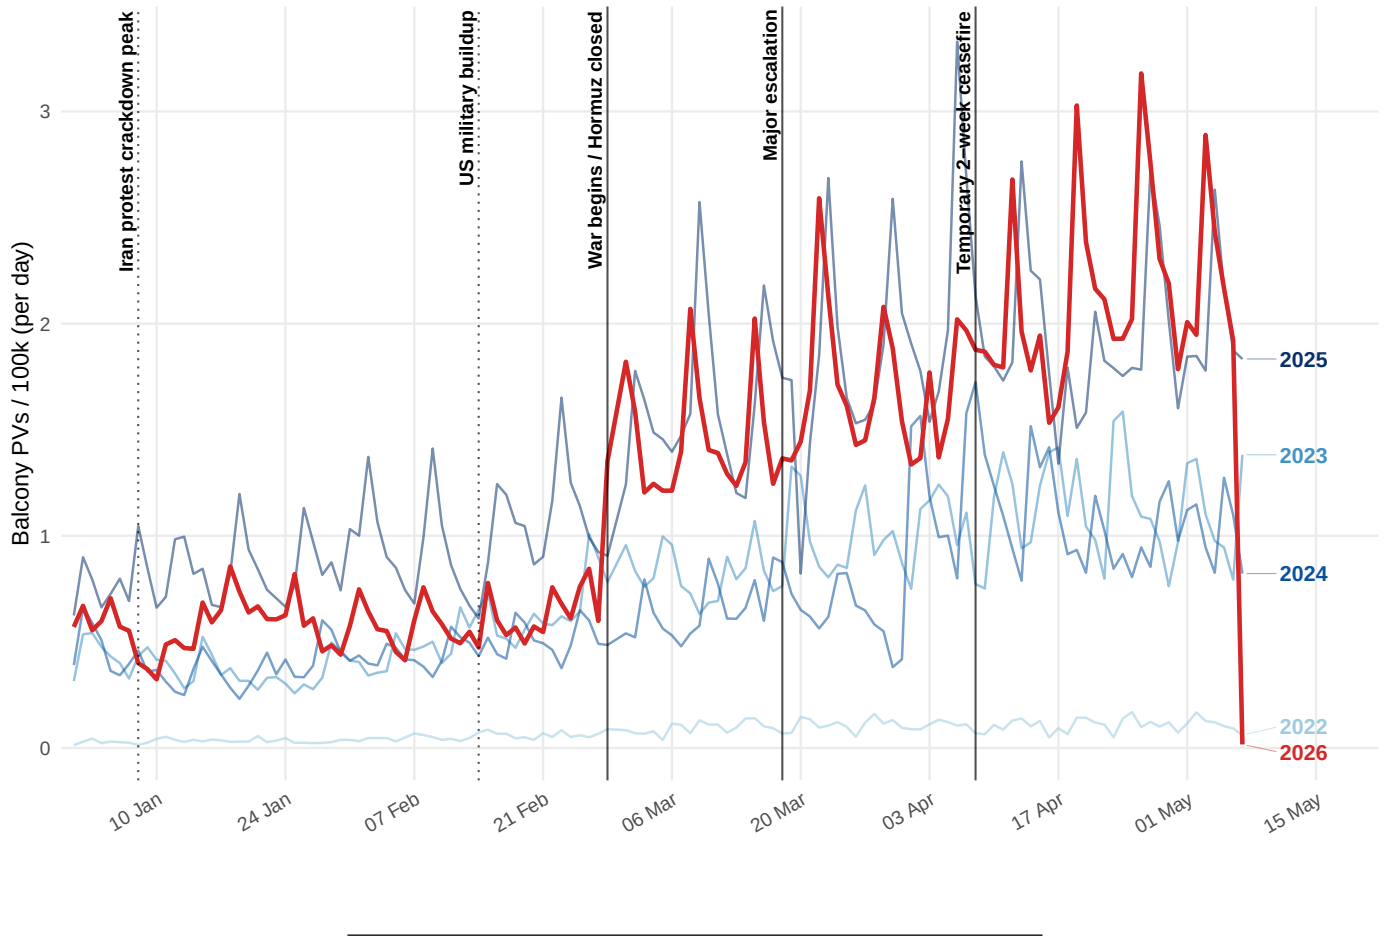

3. Figure 2 — Balcony PVs, raw daily registrations (no smoothing)

Outcome: raw daily new balcony-PV registrations per 100k, Jan – early-May overlay across years. No smoothing — every spike is a real day.

Figure 2 — Balcony PVs: raw daily new registrations, Jan–early May overlay

Germany. 2026 (red) vs 2022–2025 (blue palette, light → dark). Per 100k inhabitants.

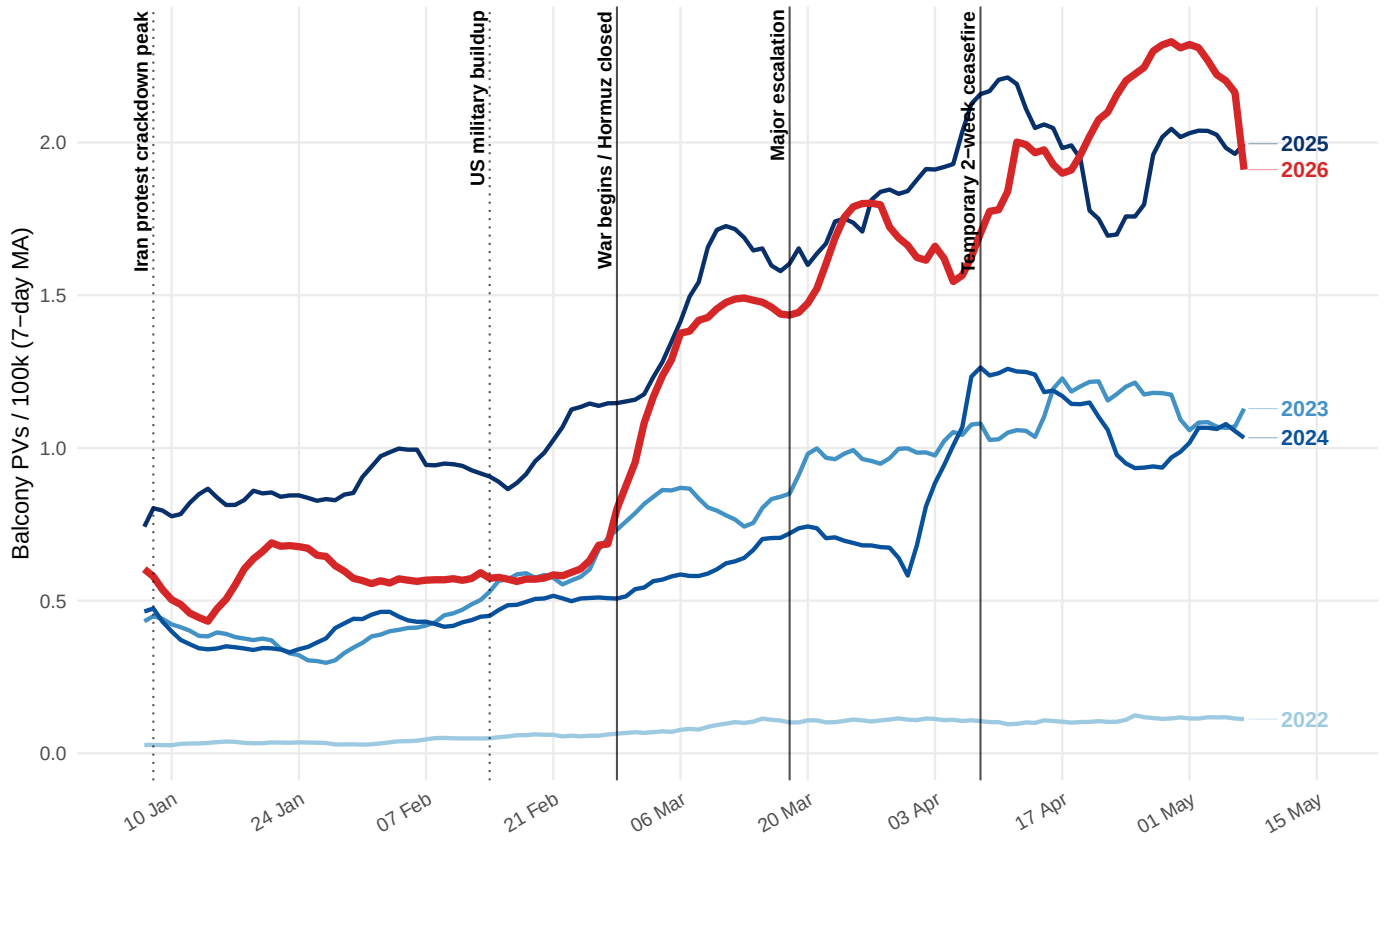

4. Figure 3 — Balcony PVs, 7-day moving average

Outcome: 7-day moving average of daily new balcony-PV registrations, per 100k. Formula: $\bar{n}_t^{(7)} = \frac{1}{7} \sum_{k=0}^6 n_{t-k}$ (right-aligned). Vertical lines = Iran-war milestones, labelled.

Figure 3 — Balcony PVs: daily new registrations (7-day MA), Jan–early May overlay

Germany. 2026 (red) vs 2022–2025 (blue palette, light → dark). Per 100k inhabitants.

5. Figure 4 — Non-balcony PVs, 7-day moving average (control)

Same construction as Figure 3 but for the non-balcony category. Acts as a control: a clean Iran-war shock should be visible on balcony PVs but much weaker (or absent) here.

Figure 4 — Non-balcony PVs: daily new registrations (7-day MA), Jan–early May overlay

Germany. Control series: shock should be much weaker or absent here.
